EXPERIENCE

QA Manager (Contract) · Bestway Healthcare *July26 – Current*

- Led QA for a greenfield digital pharmacy platform, assuring a multi-system integration between middleware, third-party clinical record systems, third-party dispensing automation and third-party logistics APIs.
- Authored a risk-based QA strategy and test plan covering integration, E2E and UAT, including entry and exit criteria, defect management and triage processes, and environment and data dependencies.
- Coordinated third-party testing suppliers, aligning their test approach, coverage and evidence to the programme strategy so quality was assured consistently across all delivery partners.
- Designed API and integration test assets, including Postman mock requirements, system test scripts, and E2E and UAT scenario packs validating data flows between the PMR, middleware and fulfilment partners.
- Engaged stakeholders across product, delivery and suppliers to surface risks early, including environment readiness issues affecting the test schedule, and reported on QA status and gate readiness.
- Established QA best practice and coached in-house and supplier teams, raising testing maturity across the programme.

Senior Automation Test Engineer (Contract) · Autoventive *Nov 2024 – Mar 2026*

- Designed and implemented a scalable Selenium BDD framework covering web and mobile, intended for handover to manual testers at contract end — built to be dynamic enough to support new feature files and steps without requiring additional page objects or locators
- Designed and built Selenium automation suites using BDD principles for web, mobile and backend API testing.
- Created a Java Gradle Docker image with Chrome and ChromeDriver for consistent test execution within Bitbucket Pipelines.
- Reduced regression suite execution time whilst increasing coverage across critical business functionality.
- Led Android mobile automation using Appium and Android Studio.
- Tested cloud deployments on AWS infrastructure as part of the CI/CD pipeline, validating service behaviour across environments.

QA Manager · Gamma *Jan 2022 – Dec 2024*

- Led the strategic rollout of AI-assisted QA practices at Gamma, introducing AI-driven page object generation to accelerate test automation development

QA Manager and Automation Specialist with 10 years' experience delivering scalable test frameworks, CI/CD integrations and QA strategy improvements across fintech, telecoms and automotive. Deep hands-on expertise in Java, Selenium and RestAssured, with solid experience in backend API testing, event-driven architecture testing and BDD/Gherkin.

An early adopter of AI-augmented engineering, using LLM-based tooling to accelerate framework development, test generation and code review — grounded in the engineering fundamentals to validate, refine and own every output. Proven track record leading agile test teams, embedding shift-left principles and driving measurable quality improvements across cloud and on-premise environments, including AWS. Well-versed in the full software testing lifecycle, mobile automation and mentoring engineers in test-driven development practices.

SKILLS

Automation & Testing

Selenium	Playwright	Appium	RestAssured
Postman	TestNG	Cucumber	Gherkin
BDD	Appium	SeeTest	Regression
UI Automation	API Testing	Event-Driven	STLC

Languages & Tools

Java	Python	JavaScript	TypeScript
Git	Bitbucket	JIRA	Xray
Maven	Gradle	SQL	MySQL
REST APIs	SOAP	Postman	Web Services

DevOps & CI/CD

Docker	Kubernetes	AWS	Jenkins
GitHub Actions	Bitbucket CI	Containers	CI/CD

Leadership

QA Strategy	Team Management	Agile	Scrum

- Built a custom Claude skill to standardise AI usage across the QA team, ensuring consistent, repeatable outputs aligned with framework conventions and reducing inconsistency in AI-generated code
- Designed and implemented a self-healing test strategy for the automation framework, incorporating token usage monitoring to control AI costs while maintaining test resilience
- Built a Java/Selenium and RestAssured framework from the ground up using Page Object Model, Cucumber and Jira Xray, covering UI, API and regression test suites — reducing maintenance overhead by around 25%.
- Led the shift from manual to automated testing, bringing cycle time down by 30% and improving time-to-market.
- Integrated the framework with Bitbucket CI/CD pipelines and configured Extent Reports dashboards for real-time test visibility.
- Wrote comprehensive API test suites using RestAssured and Postman across a microservices architecture, covering endpoint contracts, service integrations and data integrity.
- Embedded automated checks earlier in the development cycle, helping to reduce post-release defects by around 15%.
- Trained QA engineers in Java, Selenium and BDD practices, growing automation adoption by 40% and establishing an internal automation guild for knowledge sharing.
- Defined coding standards, QA conventions and version control practices across several projects to keep automation assets consistent and maintainable.

Automation Test Analyst · Worldpay *Aug 2020 – Dec 2021*

- Maintained and improved the Java/Selenium automation framework, cutting regression execution time by 15% through better test design and parallel execution.
- Contributed to Jenkins CI/CD pipeline improvements, tightening build feedback cycles and supporting continuous delivery in a high-volume payments environment.
- Set up Extent Reports dashboards to give development and product teams clear, real-time quality visibility.

Automation Test Analyst · Barclays *Jun 2018 – Jul 2020*

- Built automation tooling using the JIRA API, reducing manual test management effort by around 70%.
- Maintained and improved the mobile automation framework using SeeTest.
- Managed the core regression test pack, including execution, maintenance and feature acceptance.
- Provided automation support and technical guidance across feature teams.

Java Developer · KMP Digitata *Sep 2017 – Jun 2018*

- Developed web applications using Java, JavaScript and JSP.
- Created and documented RESTful and SOAP web services.
- Wrote Selenium automation tests and handled database operations and CI/CD processes.

DevOps Engineer · Thales UK *Feb 2017 – Sep 2017*

Shift-Left	Coaching	Test Planning	Stakeholders

EDUCATION

BSc (Hons) Computer Science
Manchester Metropolitan University
2016 · Manchester, UK

CONTACT

Bolton, BL5 1DN
Portfolio ↗

- Managed software deployment and configuration across multiple environments.
- Assessed requirements for deliverables and implemented software configuration management.

Java Developer · Tracsis *Jun 2016 – Dec 2016*

- Built ADF dashboards and widgets; implemented JAR auto-deployments to Nexus for Maven projects.
- Developed Selenium test environments and core framework, and containerised testing with Docker.
- Led UX feedback sessions and drove test optimisation initiatives.

PROJECTS

Sentinel – Agentic QA Automation Platform · *Self-Directed Build (Cursor + Claude)* 2026

End-to-end agentic UI test platform: takes a plain-English goal and a URL, plans a multi-step test, executes via Playwright, self-heals broken locators, classifies failures and produces a self-contained HTML report. Architecture and acceptance criteria directed personally; implementation generated by Cursor under direction and reviewed against spec.

- **Agentic Test Execution:** Plan–act–observe–reflect loop converts plain-English goals into structured Playwright steps, with deterministic replay from saved runs for regression-style re-runs without re-planning.
- **Self-Healing Locator Strategy:** Two-stage healer scores DOM candidates deterministically (role, accessible name, nearest text, attribute similarity), escalating to LLM-assisted choice only on low confidence; reasoning persisted to report for auditability.
- **Failure Classification:** Rule-first classifier distinguishes locator drift, assertion failures, suspected app bugs, infrastructure errors and flakes using deterministic signals before falling back to LLM judgement, keeping test signal reliable.
- **MCP-Based Architecture:** All browser actions exposed through a Model Context Protocol server, enforcing a clean boundary between agent intelligence and browser tooling — making the system tool-swappable.
- **Demoable Validation Harness:** Companion TestBed web app with toggleable chaos modes (locator drift, flake injection, broken endpoints) validates every healing and classification path end-to-end, with a GitHub Actions workflow demonstrating the agent in CI.
- **Engineering Discipline:** Per-run token-budget guardrails, structured JSON logs, unit tests around healer and classifier with mocked LLM fixtures, and ADRs documenting key trade-offs.

Tech Stack: TypeScript (strict), Node 20, pnpm workspaces, Playwright, MCP SDK, Anthropic Claude, Vitest, Next.js, GitHub Actions.
